Feature Specification

Streak System

Part A: Feature Definition & Mechanics

Part B: System Logic for Implementation

Version 1.0 — April 2026

Purpose & Problem Statement

Why: Streaks are the most common motivator in cessation apps — and the most common reason people quit the app after a relapse. A broken streak after weeks of effort feels like total erasure. Most users would rather delete the app than see a number drop to zero.

Problem: Traditional streaks are binary — perfect or failed. This punishes honesty (users lie to protect the number), ignores partial success (29 out of 30 days is exceptional), and treats one cigarette the same as a full return to smoking. Kwit's data showed engagement with streak mechanics but no reliable correlation with actual abstinence — because the streak was measuring perfection, not progress.

Goal: A dual-counter system where the current streak can break but the lifetime total never does. A freeze mechanic tied to dependency and quit stage that makes honesty cheaper than lying. Return-after-absence flows that handle real life without interrogation.

User Story

Priya has been smoke-free for 18 days. At a party on day 19, she has one cigarette. The next morning she opens LastOne. The daily check-in asks "How was yesterday?" She picks "Had one or two." A freeze is consumed. Her streak still reads 18 with a small snowflake icon. Her lifetime total reads 18. She taps "All good today" and moves on. One slip, no catastrophe.

Success Metrics

- Honest self-reporting of slips without fear of losing all visible progress.
- A growing, permanent record of smoke-free days that survives setbacks.
- Graceful return after absence without shame or excessive questioning.
- Users understand what the freeze is and use it — rather than lying or churning.
- Health milestone timeline remains motivating across the full quit journey.

1. Dual Counter System

Two numbers live on the home screen. They behave very differently under pressure — that difference is the whole point.

Counter	What It Shows	On Slip + Freeze	On Full Relapse	UI Treatment
Current Streak	Days smoke-free in the current unbroken run.	Unchanged. Snowflake icon appears.	Resets to 0. Restart or pause options offered.	Large primary number. Prominent on home screen.
Lifetime Total	Every smoke-free day ever — across all attempts.	Still increments by 1. The day counts.	Unchanged. Never decreases.	Smaller muted text below the streak. Always visible.

Think of the current streak like a Duolingo streak — it can break. Think of the lifetime total like a step-count history — it only ever goes up. One motivates daily consistency; the other protects the sense of cumulative progress.

2. How the Streak Updates

Every user action that touches the streak is listed below. There are no edge cases where a smoke-free day goes unrecorded.

Trigger / Action	Streak	Lifetime Total
Daily check-in — 'All good today'	+1	+1
Log Flow B (overcame craving)	+1	+1
Log Flow D (journal entry only)	No change. Does not confirm a smoke-free day.	No change.
Log Flow A (craving, no slip reported)	+1	+1
SOS completed with 'Better'	+1	+1
Log Flow C — 'Just a slip' + freeze available	Unchanged (freeze consumed)	+1
Log Flow C — 'Just a slip' + no freeze available	Resets to 0	Unchanged
Log Flow C — 'Been smoking again'	Resets to 0	Unchanged. Routes to restart/pause.
SOS completed with 'I smoked'	Compressed Flow C logic. Freeze/reset applies.	—
Return modal — 'Didn't smoke' (missed days)	+X for all missed days	+X

Trigger / Action	Streak	Lifetime Total
Return modal — 'Had one or two'	Frozen (1 freeze consumed)	+0 for missed period
Return modal — 'Smoked regularly'	Resets to 0	Unchanged. Routes to restart/pause.
No interaction that day (card not satisfied)	Day unconfirmed — resolved by return modal on next open	—

3. Freeze Allocation Formula

Freezes are not equal for everyone. A heavy smoker quitting for the first time gets more buffer than someone tapering out of a light habit. The matrix below determines the stock at each stage boundary.

Quit Stage	Light Smoker	Moderate Smoker	Heavy Smoker
Week 1–2	2 freezes	3 freezes	4 freezes
Week 3–4	1 freeze	2 freezes	3 freezes
Month 2–3	1 freeze	1 freeze	2 freezes
Month 4+	0 freezes	1 freeze	1 freeze

- Stock resets at each stage transition. No carry-over from previous stage.
- One freeze consumed per slip day maximum — 2 slips in one day still costs 1 freeze.
- Auto-consumed when user reports 'just a slip' or 'had one or two' — not a choice the user makes.
- Dependency level is adjustable in Settings at any time without judgement.
- If all freezes are used in a stage, the user is out until the next stage boundary.

The freeze makes honesty cheap. Without it, logging a slip costs the entire streak — so users lie. With it, logging a slip costs one freeze from a limited stock — proportionate, survivable, honest. It's the difference between a fire extinguisher and a fire alarm. One actually helps.

4. Return After Absence

When a user comes back after missing one or more days, the app doesn't punish or interrogate. A single modal resolves the gap with three honest options — the same three options regardless of how long they were gone.

Gap Duration	Modal Message	'Didn't Smoke'	'Had One or Two'	'Smoked Regularly'
1 day missed	"How was yesterday?"	Streak +1. Lifetime +1.	1 freeze consumed. Streak frozen.	Streak resets. Routes to restart or pause.
2–3 days missed	"You were away for a couple of days — all good?"	Streak +2 or +3. Lifetime +2 or +3.	1 freeze consumed. Streak frozen for the period.	Streak resets. Routes to restart or pause.
4+ days missed	"Welcome back. How have the last few days been?"	Streak +X for all missed days. Lifetime +X.	1 freeze consumed. Streak frozen.	Streak resets. Routes to restart or pause.

Sequencing: Return modal resolves missed days first. Once answered, the daily check-in card appears for today. The two never compete.

5. Home Screen Streak Display — UI States

All states the streak display can be in. Each needs a wireframe.

State	What the User Sees	Key Behaviour / Notes
Active, clean	Large number + 'days smoke-free'. Lifetime total below in muted text. Freeze stock as subtle snowflake icons.	Snowflakes are tappable — tooltip explains what a freeze is.
Freeze used	Same large number but with a snowflake icon on it. Freeze stock decremented.	'Streak protected' tooltip on tap.
Just reset	Number = 0. Lifetime total becomes visually prominent. '47 total smoke-free days — that doesn't go away.'	No red. No 'failed.' Two CTAs: Restart or Take a Break.
Personal best	Current streak exceeds longest_streak_ever. Small celebration + badge.	Shareable to quit buddy if social features are on.
Paused	Streak hidden entirely. Lifetime total visible. 'Ready to go again?' soft prompt.	All data preserved. No countdown, no pressure.
Day 0	'Your journey starts today.' Next milestone shown: '12 hours to your first win.'	No number yet. Milestone teaser drives the first 12 hours.

Edge Case States

Edge Case	Display Behaviour
No freeze + slip logged	Streak resets. Message tells user when freezes refill (next stage date) + shows lifetime total prominently.
Stage transition	Push notification: 'You've entered [Stage Name]. Your freeze stock has been refreshed to X.' Framed as progression, not a reset.

6. Health Timeline Connection

The streak directly drives a health milestone timeline. Each milestone corresponds to a medically documented recovery event. A freeze protects these milestones — one cigarette does not undo physiological recovery.

Milestone	What's Recovering	On Single Slip (Freeze)	On Full Relapse (Reset)
20 minutes	Heart rate and blood pressure normalise.	Milestone stays lit. Freeze consumed on streak only.	Drops back. Ghost marker remains.
12 hours	Carbon monoxide leaves the bloodstream.	Milestone stays lit.	Drops back. Ghost marker remains.
72 hours	Nicotine fully cleared. Taste and smell begin recovering.	Milestone stays lit.	Resets. Ghost marker remains.
2 weeks	Lung function and circulation improving.	Milestone stays lit.	Partial hold based on duration. Ghost marker remains.

Milestone	What's Recovering	On Single Slip (Freeze)	On Full Relapse (Reset)
1 month	Coughing reduces. Energy improves noticeably.	Milestone stays lit.	Partial hold. Ghost marker.
3 months	Lung capacity meaningfully improved.	Milestone stays lit.	Partial hold. Ghost marker.
9 months	Lung cilia regenerating. Infections reduce.	Milestone stays lit.	Partial hold. Ghost marker.
1 year	Heart disease risk halved vs a smoker.	Milestone stays lit.	Partial hold. Ghost marker.

Ghost markers: When a milestone drops on full relapse, it becomes a dimmed icon labelled 'previously reached.' The message: you got here before, you will get here faster this time. The past effort is visible — just like seeing your personal best in any fitness app.

PART B · SYSTEM LOGIC FOR IMPLEMENTATION

Variables, conditions, data structures. For Claude Code or a backend developer.

B1. Streak Data Structure

Field	Type	Behaviour
current_streak_days	integer	Resets to 0 on full relapse.
lifetime_smoke_free_days	integer	Never decreases. Only ever increments.
longest_streak_ever	integer	Updated when current_streak_days exceeds it.
freeze_stock	integer	Current available freezes. Decrements on slip.
freeze_max_current_stage	integer	From FREEZE_MATRIX[dependency_level][current_stage].
dependency_level	enum: light / moderate / heavy	Set in onboarding. User-adjustable in Settings.
current_stage	integer 0–5	From stage system. Drives freeze reset on transition.
streak_status	enum: active / paused / reset	Controls display and data flow.
last_confirmed_date	date	Last day user confirmed their status. Drives return modal.
streak_start_date	date	When current streak began. Recalculated on reset.

B2. Streak Update Logic

On daily confirmation (any satisfaction method):

- If no slip logged → current_streak_days += 1, lifetime_smoke_free_days += 1, last_confirmed_date = today
- If current_streak_days > longest_streak_ever → longest_streak_ever = current_streak_days, trigger personal_best celebration

On slip logged (Flow C 'one_off' or return modal 'had one or two'):

- If freeze_stock > 0 → freeze_stock -= 1, lifetime_smoke_free_days += 1, last_confirmed_date = today (streak unchanged, snowflake_indicator = true)
- If freeze_stock = 0 → current_streak_days = 0, streak_start_date = today, last_confirmed_date = today

On return to smoking (Flow C 'return_to_smoking' or return modal 'smoked regularly'):

- current_streak_days = 0

- streak_status = active (if restart chosen) with new streak_start_date, OR paused (if pause chosen)

On pause:

- streak_status = paused, streak display hidden, lifetime_smoke_free_days preserved

On resume from pause:

- streak_status = active, current_streak_days = 0, streak_start_date = today
- freeze_stock = FREEZE_MATRIX[dependency_level][current_stage]

B3. Freeze Allocation Logic

On stage transition (current_stage changes):

- `freeze_max_current_stage` = `FREEZE_MATRIX[dependency_level][new_stage]`
- `freeze_stock` = `freeze_max_current_stage` (reset, no carry-over)
- Trigger push notification: 'You've entered [stage name]. Your freeze stock has been refreshed to X.'

FREEZE_MATRIX lookup table:

dependency_level	week_1_2	week_3_4	month_2_3	month_4_plus
light	2	1	1	0
moderate	3	2	1	1
heavy	4	3	2	1

On slip logged:

- if `freeze_stock` > 0 → decrement by 1
- Maximum 1 decrement per calendar day (2 slips on same day = 1 freeze used)

On dependency_level change (user adjusts in Settings):

- `freeze_max_current_stage` recalculated from matrix
- `freeze_stock` set to new value
- No penalty applied. No judgement message shown.

B4. Return Modal Logic

Calculate: `days_missed` = today – last_confirmed_date – 1

Condition	Modal Shown
<code>days_missed</code> = 0	No modal. User opened today — daily check-in card handles it normally.
<code>days_missed</code> = 1	Show 1-day modal: 'How was yesterday?'
<code>days_missed</code> = 2 or 3	Show 2–3 day modal: 'You were away for a couple of days — all good?'
<code>days_missed</code> >= 4	Show 4+ day modal: 'Welcome back. How have the last few days been?'

Answer mapping for all modals:

Answer	current_streak_days	lifetime_smoke_free_days	last_confirmed_date
'Didn't smoke'	<code>+= days_missed</code>	<code>+= days_missed</code>	= yesterday
'Had one or two'	If <code>freeze</code> > 0: frozen (no growth for period). If <code>freeze</code> = 0: resets to 0.	No change for missed period.	= yesterday

Answer	current_streak_days	lifetime_smoke_free_days	last_confirmed_date
'Smoked regularly'	= 0. Route to Flow C3b (restart or pause).	Unchanged.	= today

After the return modal is answered, the daily check-in card appears for today. The two never compete — missed days are resolved first, then the present day is addressed.

B5. Health Timeline Logic

Milestone data structure (per milestone):

Field	Type	Notes
milestone_id	string	Unique identifier.
time_threshold_hours	integer	Hours smoke-free required to reach this milestone.
description	string	Plain-language description shown to user.
icon_ref	string	Reference to icon asset in design system.
previously_reached	boolean	Persists across resets. Enables ghost marker display.

Update conditions:

Event	Timeline Behaviour
Streak progresses	Check if <code>current_streak_days</code> x 24 >= any milestone threshold. If newly crossed: mark as reached, trigger celebration.
Single slip (freeze used)	No timeline changes. All milestones stay lit. Medically accurate — one cigarette does not undo physiological recovery.
Full relapse (streak reset)	Drop-back applies per milestone. Milestones within 72 hours of quit always reset. Beyond 2 weeks: partial hold based on duration. Set <code>previously_reached</code> = true for any that drop.
New quit attempt begins	Timeline starts from 0 but <code>previously_reached</code> milestones show as ghost markers — dimmed, labelled 'previously reached.'

B6. Data Downstream

What the streak system feeds and how.

System	What It Receives	How It's Used
Reclaim Dashboard	<code>current_streak_days</code> , <code>lifetime_smoke_free_days</code>	Drives money saved, time saved, and health recovery calculations. Lifetime variant powers the 'total' counters.
Milestones / Gamification	Streak thresholds (1d, 3d, 1wk, 2wk, 1mo, 2mo, 3mo, 6mo, 1yr)	Triggers achievement unlocks when thresholds are crossed.
Quit Buddy / Squad	<code>current_streak_days</code> , <code>streak_status</code>	Streak visible to paired buddy or squad members if social features are enabled.
AI Coach	<code>current_streak_days</code> , freeze burn rate, <code>longest_streak_ever</code> , reset frequency	Informs coaching tone and recommendations based on pattern over time.
Awareness Deck	Streak milestones	Specific content cards triggered at milestones (e.g., '72 hours — no nicotine left in your body').
