Slip Threshold & Restart Logic

Feature Spec · V1.0 · May 2026 · Internal

References: LastOne_Streak_System_Spec_V1_0 · LastOne_FeatureSpec_Template_V1

PART A: FEATURE DEFINITION

1. What This Does

Determines whether a user who logs a slip in Flow C is shown a warm reassurance screen (C3 Warm) or a gentle restart nudge screen (C3 Restart). The decision is made automatically by the system based on three inputs: freezes remaining, red_flag_count, and days since last slip.

The streak freeze allocation (per profile, per stage) is defined in LastOne_Streak_System_Spec_V1_0. This spec defines what happens after freezes are consumed.

2. Core Principle

Freezes are the first buffer. Once gone, the system watches for a pattern. A single bad week with a clear reason is protected. Repeated slips in a short window, after freezes are exhausted, trigger a gentle restart suggestion. The user is never forced to restart.

Streak impact is never shown during Flow C. It appears silently on the next home screen visit.

3. The Three Phases

Phase 1 — Freezes available

User logs a slip. One freeze is auto-consumed. Streak is protected. No flags raised. C3 Warm screen shown.

Phase 2 — Freezes exhausted, first streak break

Freezes are at zero. Next slip breaks the streak. red_flag_count increments by 1. C3 Warm screen still shown. No restart nudge yet.

Phase 3 — Pattern confirmed

red_flag_count reaches 2 or more, with less than 6 days between slips, and no freezes remaining. C3 Restart nudge screen shown.

Pattern reset condition

If 6 or more days pass since the last slip with no new slip logged, red_flag_count resets to 0. The next slip is treated as an isolated incident, not a continuation of a pattern.

4. State Table

Freezes left	red_flag_count	Days since last slip	Screen shown
1 or more	Any	Any	C3 Warm
0	0	Any	C3 Warm, streak resets
0	1	Less than 6 days	C3 Warm, streak resets
0	2 or more	Less than 6 days	C3 Restart nudge
0	Any	6 or more days	C3 Warm, flag resets to 0

5. C3 Screen Definitions

C3 Warm Screen

Shown in all Phase 1 and Phase 2 cases. Tone: steady, no drama. Streak reset (if it occurred) is not mentioned on this screen. It surfaces on the home screen silently on next visit.

Voice	Copy
Steady & Direct	You smoked. You came back to log it. That second part is the one that counts.
Emotional & Understanding	It happens. The fact that you're logging it means you haven't given up.
Real & Practical	One smoke is one data point. Logging it is how you figure out what's actually going on.

C3 Restart Nudge Screen

Shown only when `red_flag_count >= 2`, days since last slip `< 6`, and `freezes_remaining = 0`. The restart option is an encouragement, not a requirement. Three CTAs with defined visual priority:

CTA	Action	Visual Priority
Restart	Routes to Quit Date Picker, then Home	High
Take a break	Routes to Paused State, data preserved	High
Continue	Closes flow, returns Home	Low (de-emphasised)

Continue carries the least visual weight. Restart and Take a break are visually equal. The screen is an option, not a directive.

PART B: BACKEND LOGIC

B1. Data Model

New fields on the user `slip_state` object:

```
slip_state {  
  
  freezes_remaining    : number (required)    // sourced from streak system  
  
  red_flag_count       : number, default = 0  // increments on post-freeze slips  
  
  last_slip_date       : date (nullable)      // date of most recent Flow C log  
  
  pattern_window_open  : boolean, default = false // true when flags are accumulating  
}
```

B2. Logic & Conditions

B2.1 — Slip routing logic (runs on every Flow C completion)

```

IF freezes_remaining > 0

    THEN consume 1 freeze

        red_flag_count = 0

        show C3 Warm

ELSE IF freezes_remaining = 0

    AND days_since_last_slip >= 6

    THEN red_flag_count = 0

        last_slip_date = today

        streak resets

        show C3 Warm

ELSE IF freezes_remaining = 0

    AND days_since_last_slip < 6

    AND red_flag_count < 2

    THEN red_flag_count + 1

        last_slip_date = today

        streak resets

        show C3 Warm

ELSE IF freezes_remaining = 0

    AND days_since_last_slip < 6

    AND red_flag_count >= 2

    THEN show C3 Restart Nudge

```

B2.2 — Freeze stock (sourced from Streak System, not calculated here)

Freeze allocation by profile and stage is defined in LastOne_Streak_System_Spec_V1_0. This spec reads freezes_remaining as an input only.

B2.3 — red_flag_count reset conditions

Condition	red_flag_count result
Freeze consumed (Phase 1 slip)	Resets to 0
6+ days since last slip (clean window)	Resets to 0
Stage boundary crossed	Resets to 0 (freeze stock also resets per streak spec)
User restarts quit journey	Resets to 0
User enters paused state	Preserved, resumes on return

B3. Notifications

No notifications in this feature. The C3 screen itself is the only surface.

B4. API Surface

```
GET /user/slip-state -> returns slip_state object
POST /log/smoked -> logs Flow C event, triggers routing logic
                      returns { screen: 'warm' | 'restart_nudge' }
PATCH /user/slip-state/reset -> called on restart or stage boundary
```

B5. Edge Cases

Scenario	Behaviour
User restarts via C3 Restart Nudge	red_flag_count resets to 0. New quit date set. Freeze stock replenished per profile and new stage.
User chooses Take a Break	red_flag_count preserved. Paused state active. Resumes with same count when they return.
User chooses Continue from C3 Restart Nudge	No state change. red_flag_count unchanged. Next slip re-evaluates against same thresholds.
User in compressed Flow C (from SOS post_tool_state = smoked)	Same routing logic applies. C1 and C3 only, no context screens.

Scenario	Behaviour
Stage boundary occurs while flags are active	Freeze stock resets per streak spec. red_flag_count resets to 0. User gets a fresh window.
